

# Chapter I

## Introduction

### A note on the use of these Powerpoint slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book!)
- If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

## *Computer Networking: A Top Down Approach*

7<sup>th</sup> edition

Jim Kurose, Keith Ross

Pearson/Addison Wesley

April 2016

# Chapter 1: introduction

## *our goal:*

- get “feel” and terminology
- more depth, detail *later* in course

## *overview:*

- what's the Internet?
- network edge; hosts, access net, physical media
- network core: packet/circuit switching, Internet structure
- what's a protocol?
- protocol layers, service models
- performance: loss, delay, throughput
- security
- history

# Chapter 1: roadmap

1.1 *what is the Internet?*

1.2 network edge

- end systems, access networks, links

1.3 network core

- packet switching, circuit switching, network structure

1.4 delay, loss, throughput in networks

1.5 protocol layers, service models

1.6 networks under attack: security

1.7 history

# What's the Internet: "nuts and bolts" view

- billions of connected computing devices:
  - hosts* = *end systems*
  - running *network apps*

- communication links*
  - fiber, copper, radio, satellite

- transmission rate:  
*bandwidth*

Edge

- packet switches*: forward packets (chunks of data)
  - routers* and *switches*
  - network of networks as a hierarchy

Core

# “Fun” Internet-connected devices

IP picture frame  
<http://www.ceiva.com/>

Web-enabled toaster +  
weather forecaster

Tweet-a-watt:  
monitor energy use

Internet  
refrigerator

Slingbox: watch,  
control cable TV remotely

sensorized,  
bed  
mattress

Internet phones

# What's the Internet: software

- *Protocols* control sending, receiving of messages
  - e.g., TCP, IP, HTTP, Skype, 802.11
- *Internet standards*
  - RFC: Request for comments
  - IETF: Internet Engineering Task Force

# What's a protocol?

## *human protocols:*

- “what's the time?”
- “I have a question”
- introductions

... specific messages sent

... specific actions taken  
when messages  
received, or other  
events

## *network protocols:*

- machines rather than humans
- all communication activity in Internet governed by protocols

*protocols define format, order of messages sent and received among network entities, and actions taken on message transmission, receipt*

# What's a protocol?

a human protocol and a computer network protocol:

**Q:** other human protocols?

# What's the Internet: a service view

- *infrastructure that provides services to applications:*
  - Web, VoIP, email, games, e-commerce, social nets, ...
- *provides programming interface to apps*
  - hooks that allow sending and receiving app programs to “connect” to Internet
  - provides service options, analogous to postal service

## User vs Service Provider

# Chapter 1: roadmap

1.1 what is the Internet?

1.2 network edge

- end systems, access networks, links

1.3 network core

- packet switching, circuit switching, network structure

1.4 delay, loss, throughput in networks

1.5 protocol layers, service models

1.6 networks under attack: security

1.7 history

# A closer look at network structure:

## ■ *network edge:*

- **hosts:** clients and servers (servers often in data centers)
- **access networks:** hosts + wired/wireless communication links

## ■ *network core:*

- interconnected routers
- network of networks

# Access networks and physical media

*Q: How to connect end systems to edge router?*

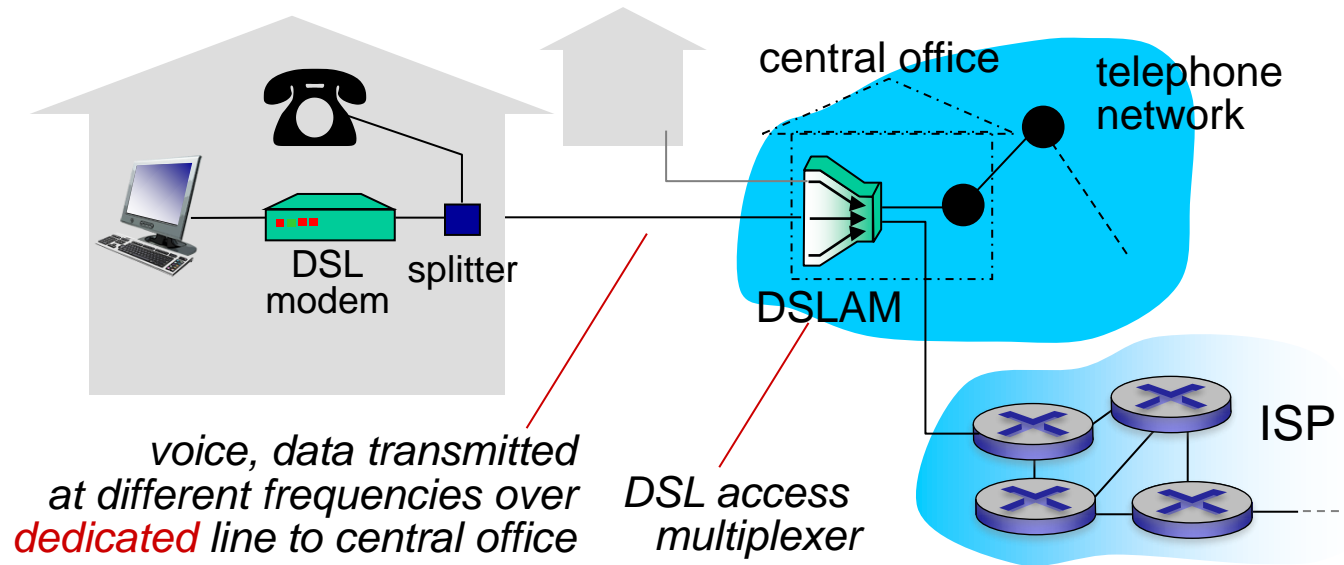

- residential access nets
- institutional access networks (school, company)
- mobile access networks

*keep in mind:*

- bandwidth (bits per second) of access network?
- shared or dedicated?

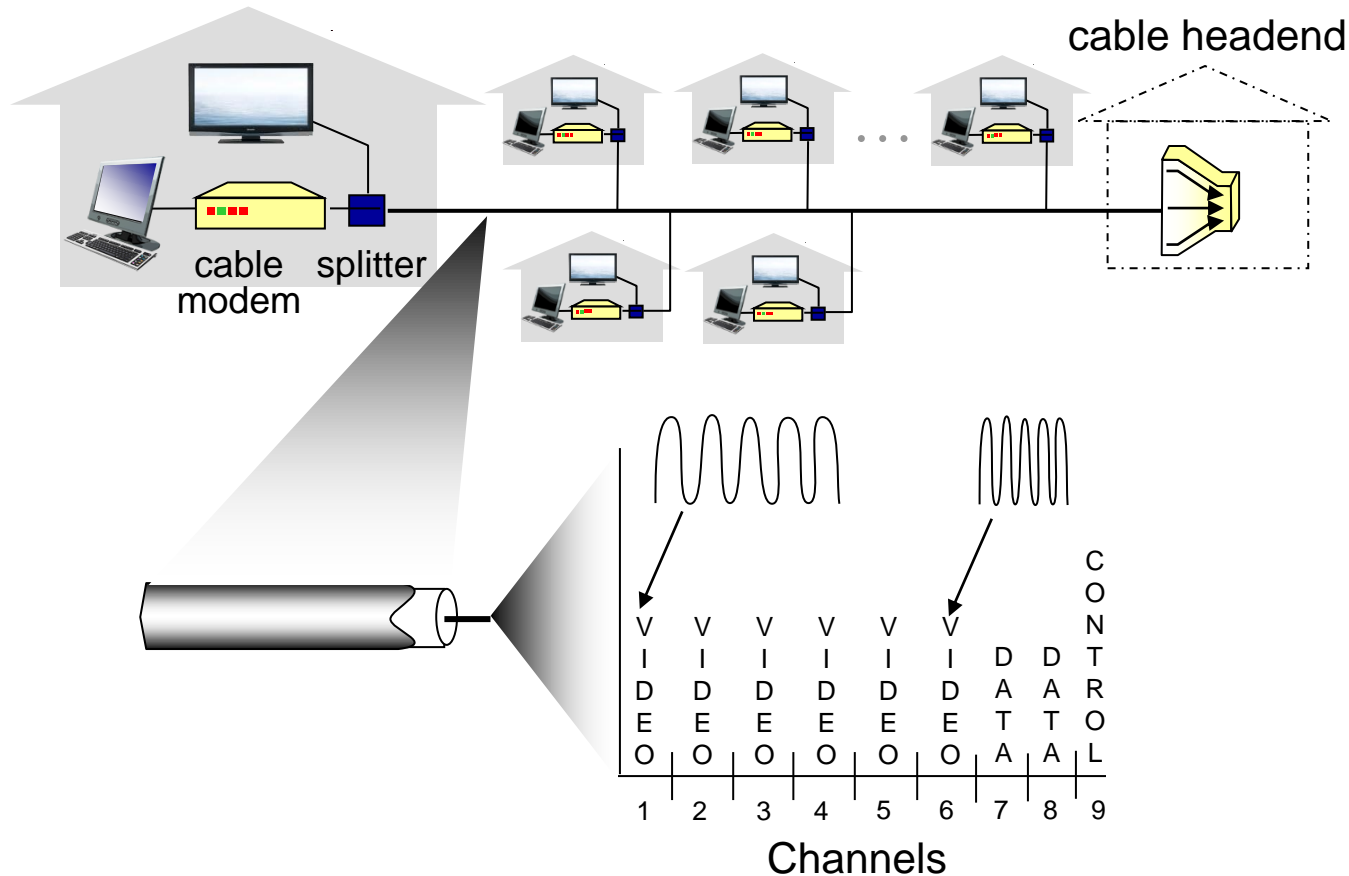

# Access network: digital subscriber line (DSL)

- use *existing* telephone line to central office DSLAM
  - data over DSL phone line goes to Internet
  - voice over DSL phone line goes to telephone net
- < 2.5 Mbps upstream transmission rate (typically < 1 Mbps)
- < 24 Mbps downstream transmission rate (typically < 10 Mbps)

# Access network: cable network

***frequency division multiplexing:*** different channels transmitted in different frequency bands

# Access network: cable network

- **HFC: hybrid fiber coax**
  - asymmetric: up to 30Mbps downstream transmission rate, 2 Mbps upstream transmission rate
- **network** of cable, fiber attaches homes to ISP router
  - homes *share access network* to cable headend
  - unlike DSL, which has dedicated access to central office

# Enterprise access networks (Ethernet)

- typically used in companies, universities, etc.
- 10 Mbps, 100Mbps, 1Gbps, 10Gbps transmission rates
- today, end systems typically connect into Ethernet switch

# Wireless access networks

- shared *wireless* access network connects end system to router
  - via base station aka “access point”

## *wireless LANs:*

- within building (100 ft.)
- 802.11b/g/n (WiFi): 11, 54, 450 Mbps transmission rate

*to Internet*

**Distributed**

## *wide-area wireless access*

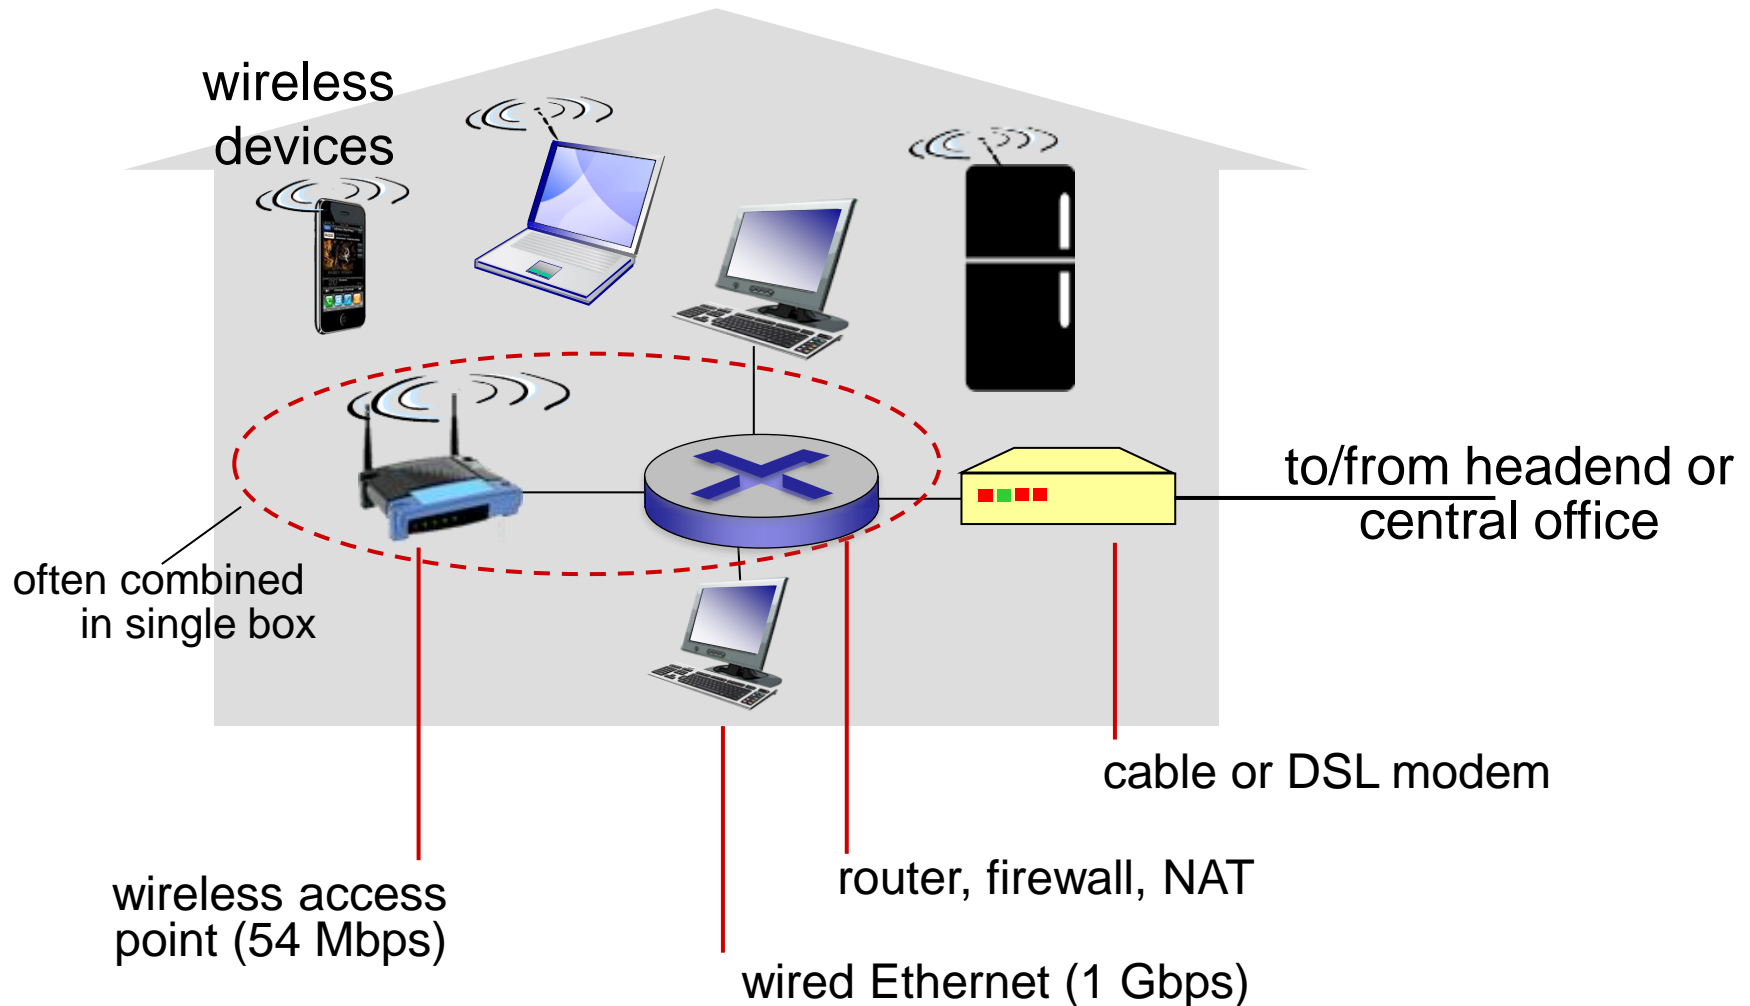

- provided by telco (cellular) operator, 10's km
- between 1 and 10 Mbps
- 3G, 4G/LTE, 5G

*to Internet*

**Centralized**

# Access network: home network

# Host: sends *packets* of data

host sending function:

- takes application message
- breaks into smaller chunks, known as *packets*, of length  $L$  bits
- transmits packet into access network at *transmission rate  $R$* 
  - link transmission rate, aka link *capacity*, aka *link bandwidth*

$$\text{packet transmission delay} = \text{time needed to transmit } L\text{-bit packet into link} = \frac{L \text{ (bits)}}{R \text{ (bits/sec)}}$$

# Physical media

- **bit:** propagates between transmitter/receiver pairs
- **physical link:** what lies between transmitter & receiver
- **guided media:**
  - signals propagate in solid media: copper, fiber, coax
- **unguided media:**
  - signals propagate freely, e.g., radio

## *twisted pair (TP)*

- two insulated copper wires
  - Category 5: 100 Mbps, 1 Gbps Ethernet
  - Category 6: 10Gbps

# Physical media: coax, fiber

## *coaxial cable:*

- two concentric copper conductors
- bidirectional
- broadband:
  - multiple channels on cable
  - HFC

## *fiber optic cable:*

- glass fiber carrying light pulses, each pulse a bit
- high-speed operation:
  - high-speed point-to-point transmission (e.g., 10' s-100' s Gbps transmission rate)
- low error rate:
  - repeaters spaced far apart
  - immune to electromagnetic noise

# Physical media: radio

- signal carried in electromagnetic spectrum
- no physical “wire”
- bidirectional
- propagation environment effects:
  - reflection
  - obstruction by objects
  - interference

## *radio link types:*

- **terrestrial microwave**
  - e.g. up to 45 Mbps channels
- **LAN** (e.g., WiFi)
  - 54 Mbps
- **wide-area** (e.g., cellular)
  - 4G cellular: ~ 10 Mbps
- **satellite**
  - Kbps to 45Mbps channel (or multiple smaller channels)
  - 270 msec end-end delay
  - geosynchronous versus low altitude
